

Problem Statement

Consumers frequently share their honest opinions, frustrations, and complaints about products and services on Reddit. These discussions contain valuable insights about product bugs, poor user experiences, unwanted features, and customer pain points. However, due to the large volume of unstructured posts and comments spread across multiple communities, it is difficult for companies and product teams to manually analyze and extract meaningful information.

There is a need for an intelligent system that can automatically collect, retrieve, and analyze Reddit discussions to identify recurring complaints, common issues, emotional sentiment, and user dissatisfaction patterns. Such a solution would help organizations better understand customer concerns and make informed decisions to improve their products and services.
